Classical Mechanics and Mathematical Method in Physics	70	30	100
Classical Electrodynamics	70	30	100
Quantum Mechanics, Atomic and Molecular Physic	100	-	100
Electronics, Numerical Methods and Computer Programming	100	-	100

PAPER - I:**CLASSICAL MECHANICS AND MATHEMATICAL METHODS IN PHYSICS****UNIT - I**

Holonomic and nonholonomic constraints: D'Alembert's Principle, Generalized coordinates, Lagrangian, Lagrange's equation and its applications, Velocity dependent potential in Lagrangian formulation. Generalized momentum, Legendre transformation, Hamiltonian, Hamilton's Canonical equation. Calculus of variations and its application to simple problems, Hamilton's variational principle, Derivation of Lagrange's and Hamilton. Canonical equation from Hamilton's variational principle. Extension of Hamilton's Principle for nonconservative and nonholonomic systems. Method of Lagrange's multipliers,

UNIT - II

Conservation principle and Noether's theorem. Conservation of energy, linear momentum and angular momentum as a consequence of homogeneity of time and space and isotropy of space respectively. **Canonical transformation, integral invariants of Poincare:** Lagrange's and Poisson brackets as canonical invariants. Equation of motion in Poisson bracket formulation, Infinitesimal contact transformation and generators of symmetry, Liouville's theorem, Hamilton Jacobi equation and its applications.

UNIT - III

Action angle, variable adiabatic invariance of action variable : The Kepler problem in action angle variables, theory of small oscillation in Lagrangian formulation, normal coordinates and its applications, Orthogonal transformation, Eulerian angles, Euler theorem, Eigen values of the inertia tensor, Euler equations. Force free motion of a rigid body. Laplace transforms, and their properties, Laplace transform of derivatives and integrals of Laplace transform, Laplace, Convolution theorem, Impulsive function Application of Laplace transform in solving linear differential equations with constant coefficient with variable coefficient and linear partial differential equation.

UNIT - IV

Fourier Transforms: Development of the Fourier integral from the Fourier series, Fourier and inverse Fourier transform: Simple applications: Finite wave train, wave train with Gaussian amplitude, Fourier transform of Derivatives, Solution of wave equation as an application, Convolution theorem, intensity in term of spectral density for quasi-monochromatic EM waves, momentum representation. Application of Hydrogen Atom and Harmonic Oscillator

problems. Application of Fourier Transform to Diffraction Theory; Diffraction pattern of one two slits.

UNIT - V

Coordinate transformation in N-dimensional space: Contrarian and covariant tensor, Jacobian. Relative tensors, pseudo tensors (Example: change density, angular momentum) Algebra of tensors, Metric theorem, Associated tensors, Riemannian space (Example: Euclidian space and 4-D Minkowski space), Christoffel symbols, transformation of Christoffel symbols, Covariant differentiation. Ricci's theorem, Divergence, Curl and Laplacian in tensor form. Stress and Strain tensors. Hook's law in tensor form. Lorentz Covariance of Maxwell equation.

Group of transformations. (Example: symmetry transformation of square), Generators of a finite group, Normal subgroup, Direct product of groups.. Isomorphism and Homomorphism. Representation theory of finite groups, Invariant subspace and reducible representations, irreducible representation, Crystallographic point groups. Irreducible representation of C_{4v} Translation group and the reciprocal lattice.

REFERENCE BOOKS:

1. Goldstein - Classical Mechanics.
2. Landau and Lifshitz - Classical Mechanics.
3. A. Raychoudhary - Classical Mechanics.
4. Mathematical Methods for Physicists: George Arfken (Academic Press).
5. Applied Mathematics for Engineers and Physicists: L. A. Pipe (McGraw Hill)
6. Mathematical Methods - Potter and Goldberg (Prentice Hall of India).
7. Elements of Group Theory for Physicists: A. W. Joshi (Wiley Eastern Ltd.)
8. Vector Analysis (Schaum Series) (Mc Graw Hill).

PAPER -II: CLASSICAL ELECTRODYNAMICS

UNIT - I

1. **Electrostatics: Electric field;** Gauss law, Differential form of Gauss law. Another equation of electrostatics and the scalar potential, surface distribution of charges and dipoles and discontinuities in the electric field and potential, Poisson and-Laplace equations, Green's Theorem, Uniqueness of the solution with Dirichlet or Neumann Boundary conditions, Formal solution of Electrostatic Boundary value problem with Green's Function, Electrostatic potential energy and energy density, capacitance.

Boundary- Value Problems in Electrostatics: Methods of Images, Point charge in the presence of a grounded conducting sphere point charge in the presence of a charge insulated conducting sphere, Point charge near a conducting sphere at fixed potential, conducting sphere in a uniform electric field by method of images, Green function for the sphere, General solution for the potential, Conducting sphere with Hemispheres at different potential, orthogonal functions and expansion.

UNIT - II

1. **Magneto statics:** Introduction and definition, Biot, and Savart law, the differential equation of magnetostatics and Ampere's law, Vector potential and Magnetic induction for a circular current loop, Magnetic fields of a localized current distribution, Magnetic moment, Force and torque on and energy of a localized current distribution in an external magnetic induction, Macroscopic equations. Boundary conditions on B and H. Methods of solving Boundary-value problems in magneto statics, Uniformly magnetized sphere, Magnetized sphere in an external field, Permanent magnets, Magnetic shielding, spherical shell of permeable material in a uniform field.

UNIT - III

1. **Multiples', Electrostatics of Macroscopic Media Dielectrics:** Multiple expansion, multipole expansion of the energy of a charge distribution in an external field, Elementary treatment of electrostatics with permeable media, Boundary value problems with dielectrics. Molar polarizability, and electric susceptibility. Models for molecular polarizability, Electro-static energy in dielectric media. .

2. **Time varying fields, Maxwell's equations Conservation Laws:** Energy in a magnetic field, Vector and Scalar potentials. Gauge transformations, Lorentz gauge, Coulomb gauge, Green functions for the wave equation, Derivation

of the equations of Macroscopic Electromagnetism, Poyntings theorem and conservations of energy and momentum for a system of charged particles. And EM fields. Conservation laws for macroscopic media. Electromagnetic field tensor. Transformation of four potentials and four currents. Tensor description of Maxwell's equation.

UNIT - IV

1. Plane Electromagnetic Waves and Wave Equation: Plane wave in a nonconducting medium. Frequency dispersion characteristics of dielectrics, conductors and plasmas, waves in a conducting or dissipative medium, superposition of waves in one dimension, group velocity, causality connection between D and E. Kramers-Kronig relation. .

2. Covariant Form of Electrodynamics Equations: Mathematical properties of the space-time special relativity, Invariance of electric charge covariance of electrodynamics, Transformation of electromagnetic fields. Radiation by moving charges : Lienard-wiechert Potentials for a point charge, Total power radiated by an accelerated charge, Larmor's formula and its relativistic generalization, Angular distribution of radiation emitted by an accelerated charge, Radiation emitted by a charge in arbitrary extremely relativistic motion. Distribution in frequency and angle of energy radiated by accelerated charges, Thomson scattering and radiation, Scattering by quasi free charges, coherent and incoherent scattering, Cherenkov radiation.

3. Magnetohydrodynamics and Plasma Physics: Introduction and definitions, MHD equations Magnetic diffusion viscosity and pressure; Pinch effect. Instabilities in a pinched plasma column. Magnetohydrodynamic waves; Plasma oscillations, short wave length limit of plasma oscillations and Debye shielding distance.

4. Radiation damping, self fields. of a particle, scattering and absorption of radiation by a bound system: Introductory considerations, Radioactive reaction force from conservation of energy, Abraham Lorentz evaluation of the self force, difficulties with Abraham Lorentz model; Integro-differential equation of motion including radiation damping, Line Breadth and level shift of an oscillator, Scattering and absorption of radiation. by an oscillator, Energy transfer to a harmonically bound charge.

REFERENCE BOOKS:

1. J.D. Jackson-. -Classical Electrodynamics
2. Panofsky and Philips Classical Electricity and Magnetism'
3. Introduction to Electrodynamics- Griffiths
4. Landau and Lifshitz--Classical Theory of Field
5. Landau and Lifshitz.:.Elec trodynamics of Continuous Media

PAPER -III:
QUANTUM MECHANICS, ATOMIC AND MOLECULAR PHYSICS

UNIT - I

States, Amplitudes and Operators: States of a quantum mechanical system, representation of quantum mechanical states, properties. Of quantum mechanical amplitude; operators and change of state, a complete set of basis states, Products of linear operators, language of quantum mechanics, postulates, essential definitions and commutation relations.

Observable and description of system: Process of measurement, expectation values, time dependence of quantum mechanical amplitude, observables with no classical analogue, spin. dependence of quantum-mechanical amplitude on position. the wave function, super-position of amplitudes, identical particles.

The Co-ordinate Representation: Compatible observables, quantum conditions and uncertainty relation, Co-ordinate representation, of operator & position, momentum and angular momentum, time dependence of expectation values, the Ehrenfest's theorem; the time evolution of wave function, the Schrodinger equation, energy quantization, , periodic potential as an example.

UNIT - II

Symmetries and Angular momentum: (a) Compatible observables and constants of motion, symmetry' transformation and conservation laws, invariance, under space and time translations and space rotation and conservations of momentum, energy and angular momentum. Angular momentum operators and, their eigen values, matrix representations of the angular momentum operators and their eigenstates, co-ordinate representations of the orbital angular momentum operators and their eigen state (spherical harmonics), composition of angular momentum, Clebsch-Gordon coefficients tensor operators and Wigner Eckart theorem,

commutation relations, of J_x, J_y, J_z with reduced spherical tensor operator, matrix elements of vector operators, time reversal invariance and vanishing of static electric dipole moment of a stationary state.

UNIT - III

Hamiltonian matrix and the time evolution of Quantum mechanical States:

Hermiticity of the Hamiltonian matrix, Time independent perturbation of an arbitrary system, simple matrix examples of time-, independent perturbation, energy given states of a two state system, diagonalizing of energy matrix, time independent perturbation of two state system the perturbative solution: Weak field and strong field cases, general description of two state system. Pauli matrices. Ammonia molecule as an example of two state systems.

Interaction with External Fields: Non degenerate first order stationary perturbation method, atom in a weak uniform external electric field and first and second order Stark effect, calculation of the polarizability of the ground state of H-atom and of an isotropic harmonic oscillator, Degenerate stationary perturbation theory. Linear Stark effect for H-atom levels, inclusion of spin-orbit and weak magnetic, field, Zeeman Effect, strong magnetic field and calculation of interaction energy.

UNIT - IV

Transition between Stationary States: Transitions in a two state system, Time independent perturbations-The Golden rule, phase space, emission and absorption of radiation, induced dipole transition and Spontaneous emission of radiation. Energy width of a quasi stationary state.

Systems with Identical Particles: In distinguish ability and , exchange symmetry, many particle wave functions and Pauli's exclusion principle, spectroscopic terms for atoms. The Helium atom, Variation method and its use in the calculation of ground state and excited state energy, Helium atom. The Hydrogen molecule, Heitler-London method for molecule, WKB method for one dimensional problem, application to bound states (Bohr-Sommerfeld quantization) and the barrier penetration (alpha decay, problems).

UNIT - V

Hydrogen Atom : Gross structure energy spectrum, probability distribution of radial and angular ($l=1,2$) wave functions (no derivation), effect of spin, relativistic correction to energy levels and fine structure, magnetic dipole interaction and hyperfine structure, the Lamb shift (only a qualitative description)

Spectroscopy(qualitative) : General features of the spectra of one and two electron system-singlet, doublet and triplet characters of emission spectra, general features of Alkali spectra, rotation and vibration band spectrum of a molecule, P, Q and R branches, Raman spectra for rotational and vibrational transitions, comparison with infra red spectra. General features of electronic spectra. Frank and Condon's principle.

10. Herzberg- Molecular Spectra.

PAPER IV:
ELECTRONICS, NUMERICAL METHOD AND COMPUTER
PROGRAMMING

UNIT- I

Operational Amplifiers: .Differential amplifier - circuit configurations-dual input, balanced output differential amplifier. DC analysis - AC analysis, inverting and noninverting inputs, CMRR - constant current bias level translator.

Block diagram of a typical Op-Amp-analysis. Open loop configuration, inverting and non-inverting amplifiers.Op-amp with negative feedback - voltage series feedback -effect of feedback on closed loop gain, input resistance, output resistance, bandwidth and output offset voltage - voltage follower.

Practical op-amp-input offset voltage -input bias current -input offset current, total output offset voltage, CMRR frequency response. DC and AC

amplifier, summing, scaling and averaging amplifiers, instrumentation amplifier, integrator and differentiator.

UNIT - II

Oscillators and Wave Shaping Circuits: Oscillator Principle- Oscillator types, Frequency stability, response, The Phase shift oscillator, Wein bridge Oscillator, LC tunable oscillators, Multivibrators-Monostable and Astable, Comparators, Square wave and Triangle wave generation, Clamping and Clipping.

Voltage regulators- Fixed regulators, Adjustable voltage regulators, switching regulators.

UNIT - III

Digital Electronics: Combinational Logic :The transistor as a switch; circuit Realization of OR,AND,NOT, NOR and NAND gates, Exclusive OR gate, Boolean algebra - Demerger's theorems Adder, Subtract or, Comparator, Decoder / Demultiplexer ,Data selector/ multiplexer -Encoder.

Sequential Logic: Flip -Flops: one-bit memory; The RS Flipflop, JK Flip- Flop, JK master slave Flip -Flops, T Flip -Flop, D Flip- Flop, Shift registers - synchronous and asynchronous counters- cascade counters, Binary counter, Decade counter.

Basic concepts about fabrication and characteristics of integrated circuits.

Fortran 77: Variable, Expression, jumping. Bracching an looping statement

,Input / Output statement for handling Input / Output Files, Subroutine,

External, Function ,Special statements ,COMMON,ENTRY

FORMAT,PAUSE,Equivalence . Programming of simple problems involving use of interpolation differentiation, Integration, matrix inversion and least square analysis.

UNIT - IV

Errors in numerical analysis: Source of error, Round off error, Computer Arithmetic, Error Analysis, Condition and stability, Approximation, Functional and Error analysis, the method of, Undetermined Coefficients. Use of interpolation formula, Iterated interpolation. Inverse interpolation,Hannite interpolation and Spline interpolation, Solution of Linear equations , Direct and Iterative methods, Calculation of eigen value and eigen vectors for symmetric matrices.

Solution of Nonlinear equation: Bisection method, Newton's method,,modified Newton's method, method of Iteration, Newton's method and method of iteration for a system of cosuation Newton's method for the case of complex roots.

UNIT - V

Integration of a function: Trapezoidal and Simpson's rules. Gaussian quadrature formula, Singular integrals, Double integration.

Integration of Ordinary differential equation: Predictor - corrector methods, Runga-Kutta method, Simultaneous and Higher order equations Numerical Integration and Differentiation of Data, Least-Squares

Approximations, Fast Fourier Transform. .

Some elementary information about Computer: CPU, Memory, Input/ Output devices, Super, Mini and Micro systems, MS-DOS operating system, High Level Languages, Interpreter and Compiler. Programming: Algorithm and Flowchart.

LIST OF EXPERIMENTS FOR M.Sc. PREVIOUS

List of Experiments (any eighteen):

1. To design a single stage amplifier of a given voltage gain and lower cut of frequencies.
2. To determine Lo. Co. and Rf of a given coil and to study the variations of Rf with frequency.
3. To design a RC coupled two stage amplifiers of a given gain and the cutoff frequencies.
4. To study Hartley oscillator.
5. To Study Transistor bias Stability.
6. To design a Multivibrator of given frequency and study its wave shape.
7. To study the characteristics of FET and use it to design a relaxation oscillator and measure its frequency.
8. To study the characteristics of an operational amplifier.
9. To study the characteristics of a UJT and use it to design a relaxation oscillator and measure its frequency.
10. To study the addition, integration and differentiation properties of an operational amplifier.
11. Determine Plack constant using solar Cell.
12. To determine Plack constant and work function by a photo-cell.
13. To study regulated power supply using (A) Zener diode only (b) Zener diode with a series transistor (c) Zener diode with a shunt transistor.
14. To verify Fresnel's formula;
15. To study the percentage regulation and variation of Ripple factor, withload for a full wave rectifier. .
16. To study analog to digital and digital to analog conversion.
17. To study a driven mechanical oscillator.
18. To verify Hartmann's formula using constant deviation spectrograph.
19. To find e/m of electron using Zeeman effect.
20. To find Dissociation energy to I.
21. Study of CH Bands.
22. Salt Analysis / Raman effect (Atomic).
23. Design and study of pass filters.
24. Michelson Interferometer.
25. Fabry parot Interferometer.
26. Determination of velocity of Ultrasonic waves.
27. Study of Elliptically polarised light by Babinet Compensator.
28. Veafication of Cauchey's Dispersion relation.
29. Study of DC gatecontrol characteristics and Anode current characteristics of SCR.

NIMS UNIVERSITY, JAIPUR

M. Sc. PHYSICS FINAL

M. Sc PHYSICS FINAL

- **Paper-I** Advanced Quantum Mechanics and Introductory Quantum Field Theory
- **Paper II.** Nuclear Physics
- **Paper III** Statistical and Solid State Physics
- **Paper-IV (A)** Microwave Electronics.

OR

- **Paper-V (B)** Condensed Matter Physics

- **List of Experiments for M.Sc. Final**

LIST OF EXPERIMENTS FOR M.Sc. PREVIOUS

Schema:

The examination will be conducted for two days, 6 Hrs. each day. The distribution of the marks will be as Follows:

	Marks
Two experiments	120
Viva	40
Record	40
Total	200
Minimum Pass Marks	72

List of Experiments (any eighteen):

1. To design a single stage amplifier of a given voltage gain and lower cut of frequencies.
2. To determine L_o , C_o and R_f of a given coil and to study the variations of R_f with frequency.
3. To Design a RC coupled two stage amplifies of a given gain and the cut off frequencies.
4. To Study Hartley oscillator.
5. To Study Transistor bias Stability.
6. To design a Multivibrator of given frequency and study its wave shape
7. To Study the Characteristics of FET and use it to design an relaxation oscillator and measure its frequency
8. To Study the Characteristics of an operational amplifier
9. To Study the Characteristics of a UJT and use it to design a relaxation oscillator and measure its frequency.
10. To study the addition ,Integration and differentiation properties of an operational amplifier.
11. Determine Plack constant and work function by a photo-cell.
12. To determine Plack constant and work function by a pjoto-cell.
13. To study regulated power supply using (A)Zener diode only (b) Zener diode with a series transistor (c) Zener diode with a shunt transistor
14. To Verify Fresnel's formula.
15. To study the percentage regulation and variation of Ripple factor, with load for full wave rectifier
16. To study analog to digital and digital to analog conversion.
17. To study a driven mechanical oscillator.
18. To verify Hartmann's formula using constant deviation spectrograph
19. To find e^-m of electron using Zeeman effect.
20. To find Dissociation energy to I.
21. Study of CH Bands

22. Salt Analysis/ Raman effect (Atomic)
23. Design and study of pass filters
24. Michelson Interferometer
25. Fabry potot Interferometer
26. Determination of velocity of Ultrasonic waves.
27. Study of Elliptically polarised light by babinet Compensator.
28. Verification of Cauchy's Dispersion relation.
29. Study of DC gate control Characteristics and Anode current characteristics of SCR

PAPER -I

ADVANCED QUANTUM MECHANICS AND INTRODUCTORY QUANTUM FIELD THEORY

Max.Marks :100

Duration: 3hrs.

Note: Five questions are to be set taking one from each unit (each question will have an internal choice). Student will attempt all the five questions. 40% weightage will be given to problems and numericals.

UNIT - I

Scattering (non-relativistic): Differential and total scattering cross section, transformation from CM frame to Lab frame, solution of scattering problem by the method of partial wave analysis, expansion of a plane wave into a spherical wave and scattering amplitude, the optical theorem, Applications.- scattering from a delta potential, square well potential and the hard sphere scattering of identical particles, energy dependence and resonance scattering. Breit-Wigner formula, quasi stationary states. The Lippman-Schwinger equation and the Green's function approach for scattering problem, Born approximation and its validity for scattering problem, Coulomb scattering problem under first Born approximation in elastic scattering.

Relativistic Formulation and Dirac Equation: Attempt for relativistic formulation of quantum theory, The Klein-Gordon equation, Probability density and probability current density, solution of free particle KG equation in momentum representation, interpretation of negative probability density and negative energy solutions.

UNIT - II

Dirac equation for a free particle, properties of Dirac matrices and algebra of gamma matrices, non-relativistic correspondence of the Pauli equation (inclusive of electromagnetic interaction). Solution of the free particle. Dirac equation, orthogonality and completeness relations for Dirac spinors, interpretation of negative energy solution.

Symmetries of Dirac Equation : Lorentz covariance of Dirac equation, proof of covariance and derivation of Lorentz boost and rotation matrices for Dirac spinors, Projection operators involving four momentum and spin, Parity (P), Charge conjugation (C), time reversal (T) and CPT operators for Dirac spinors, Bilinear covariants, and their transformation behaviour under Lorentz transformation, P, C, T and CPT, expectation values of coordinate and velocity, involving only, positive energy solutions and the associated problems, inclusion of negative energy solution, Zitterbewegung, Klein paradox.

UNIT - III

The Quantum Theory of Radiation : Classical radiation field, transversality condition, Fourier decomposition and radiation oscillators, Quantization of radiation oscillator, creation, annihilation and number operators; photon states, photon as a quantum mechanical excitation of the radiation field, fluctuations and the Uncertainty relation, validity of the classical description, matrix element for emission and absorption, spontaneous emission in the dipole approximation, Rayleigh scattering. Thomson scattering and the Raman Effect, Radiation damping and Resonance fluorescence.

UNIT - IV

Scalar and vector fields: Classical Lagrangian field theory, 'Euler-Lagrange's equation, Lagrangian density for electromagnetic field. Occupation number representation for simple harmonic oscillator, linear array of coupled oscillators, second quantization, of identical bosons, second quantization of the real Klein Gordan field and complex, Klein-Gordan field, the meson propagator.

The occupation number representation for fermions, second quantization of the Dirac field, the fermion propagator, the e.m. interaction and gauge invariance, covariant quantization of the free electromagnetic field, the photon propagator.

UNIT - V

S-matrix, the S-matrix expansion, Wick's theorem, Diagrammatic representation in configuration space, the momentum representation, Feynman diagrams of basic processes, Feynman rules of QED. Applications of S matrix formalism: the Coulomb scattering, Bhabha scattering, Moller scattering, Compton scattering and pair production.

REFERENCE BOOKS :

2. E. Merzbaker : Quantum Mechanics, Second Edition (John Wiley and sons)
3. Bjorken and Drell : Relativistic Quantum Mechanics (MGraw Hill)
4. J.J. Sakuri : Advanced Quantum Mechanics (John Wiley)
5. F. Mandal & G. Shaw, Quantum Field Theory (John Wiley)
6. J.M. Ziman, Elements of Advance Quantum Theory, (Cambridge University Press).

PAPER - II: NUCLEAR PHYSICS

Max.Marks :100

Duration: 3hrs.

Note: Five questions are to be set taking one from each unit (each question will have an internal choice). Student will attempt all the five questions. 40% weightage will be given to problems and numericals.

UNIT - I

Nucleon-Nucleon Scattering and Potentials : Partial wave analysis of the neutron-proton scattering at low energy assuming central potential with square well shape, concept of the scattering length, coherent scattering of neutrons by protons in (ortho and para) hydrogen molecule; conclusions of these analyses regarding scattering lengths, range and depth of the potential; the effective range theory (in neutron-proton scattering) and the shape independence of nuclear potential; A qualitative discussion of proton proton scattering at low energy: General features of two-body scattering at high energy Effect of exchange forces: Phenomenological Hamada- Johnston hard core potential and Reid hard core and soft core potentials; Main features of the One boson Exchange Potentials (OBEP) no derivation.

UNIT - II

Two Nucleon system and Nuclear Forces: General nature of the force between nucleons, saturation of nuclear forces, charge independence and spin dependence, General forms of two nucleon interaction, central, noncentral and velocity dependent potentials, Analysis of the ground state (3S_1) of deuteron using a square well potential, range-depth relationship, excited states of deuteron, Discussion of the ground state of deuteron under noncentral force, calculation of the electric quadrupole and magnetic dipole moments and the D-state admixture. **Experimental Techniques:** Gas filled counters; Scintillator counter, Cerenkov counters; Solid state detectors; Surface barrier detectors; Electronic circuits used with typical nuclear detectors; Multiwire proportion chambers; Nuclear emulsions, techniques of measurement and analysis of tracks; Proton synchrotron; Linear accelerations; Acceleration of heavy ions.

UNIT - III

Nuclear shell model: Single particle and collective motions in nuclei: Assumptions and justification of the shell model, average shell potential, spin orbit coupling; single particle wave functions and level sequence; magic numbers; shell model predictions for ground state parity; angular momentum, magnetic dipole and electric-quadrupole moments; and their comparison with experimental data; configuration mixing; single particle transition probability according to the shell model; selection rules; approximate estimates for the transition probability and Weisskopf units: Nuclear isomerism. **Collective nuclear models:** Collective variable to describe the cooperative modes of nuclear motion; Parametrization of nuclear surface; A brief description of the collective model Hamiltonian (in the quadratic approximation); Vibrational modes of a spherical nucleus, Collective modes of a deformed even-even nucleus and moments of inertia; Collective spectra and electromagnetic transition in even nuclei and comparison with experimental data; Nilsson model for the single particle states in deformed nuclei.

UNIT - IV

Interaction of radiation and charged particle with matter (No derivation): Law of absorption and attenuation coefficient; Photoelectric effect, Compton scattering, pair production; Klein-Nishina cross sections for polarized and unpolarized radiation, angular distribution of scattered photon and electrons, Energy loss of charged particles due to ionization, Bremsstrahlung; energy target and projectile dependence of all three processes, Range-energy curves; Straggling.

Nuclear Reactions: Theories of Nuclear Reactions; Partial wave analysis of reaction Cross section; Compound nucleus formation and breakup, Resonance scattering and reaction- Breit-Wigner dispersion formula for S-waves ($l=0$), continuum cross section; statistical theory of nuclear reactions, evaporation probability and cross section for specific reactions; The optical model, Stripping and pick-up reactions and their simple theoretical description (Butler theory) using plane wave Born approximation (PWBA) Shortcomings of PWBA nuclear structure studies with deuteron stripping (d,p) reactions.

UNIT - V

Nuclear gamma and beta decay: Electric and magnetic multipole moments and gamma decay probabilities in nuclear system (no derivations), Reduced transition probability, Selection rules; Fermi transition and zero. Zero transition.

General characteristics of weak interaction; nuclear beta decay and lepton capture; electron energy spectrum and Fermi- Kurie plot; Fermi theory of beta decay (parity conserved selection rules Fermi and Gamow-Teller) for allowed transitions; ft-values; General interaction Hamiltonian for beta decay with parity conserving and non conserving terms; Forbidden transitions, Experimental verification of parity violation; The V-A interaction and experimental evidence.

PAPER-VII: STATISTICAL AND SOLID STATE PHYSICS

Max.Marks :100

Duration : 3hrs.

Note: Five question are to be set taking one from each unit(each question will have an internal choice).Student will attempt all the five questions. 40% weightage will be given to problems and numericals.

UNIT - I

Basic Principles, Canonical and Grand Canonical ensembles: Concept of statistical distribution, phase space, density of states, Liouville's theorem, systems and ensemble, entropy in statistical mechanics Connection between thermodynamic and statistical quantities micro canonical ensemble, equation of state, specific heat and entropy of a perfect gas, using micro canonical ensemble. Canonical ensemble, thermodynamic functions for the canonical ensemble, calculation of mean values, energy fluctuation in a gas, grand Canonical ensemble, thermodynamic functions for the grand canonical ensemble, density fluctuations.

UNIT - II

Partition functions and Statistics: Partition functions and Properties, partition function for an ideal gas and calculation of thermodynamic quantities, Gibbs Paradox, validity of classical approximation, determination of translational, rotational and vibrational contributions to the partition function of an ideal diatomic gas. Specific heat of a diatomic gas, ortho and para hydrogen.

Identical particles and symmetry requirement, difficulties with Maxwell-Boltzmann statistics, quantum distribution functions, Bose-Einstein and Fermi-Dirac statistics, Boson statistics and Planck's formula, Bose Einstein condensation, liquid He as a Boson system, quantization of harmonic oscillator and creation and annihilation of Phonon operators, quantization of fermion operators.

UNIT - III

Band Theory: Bloch theorem, Kronig Penny model, effective mass of electrons, Wigner-Seitz approximation, NFE model, tight binding method and calculation of density for a band in simple cubic lattice, pseudo potential method.

Semiconductors: law of mass action, calculation of impurity conductivity, ellipsoidal energy surfaces in Si and Ge, Hall effect, recombination mechanism, optical transitions and Shockley-Read theory excitons, photoconductivity, photo-Luminescence. Point defects, planar and bulk defects, colour centres, F-centre and aggregate centres in alkali halides.

UNIT - IV

Theory of Metals: Fermi-Dirac distribution function, density of states, temperature dependence of Fermi energy, specific heat, use of Fermi-Dirac statistics in the calculation of thermal conductivity and electrical conductivity,

Wiedemann -Franz ratio, susceptibility, width of conduction band, Drude theory of light, absorption in metals.

Lattice Vibrations and Thermal Properties: Interrelations between elastic constants C_{11} , C_{12} and C_{44} wave propagation and experimental determination of elastic constant of cubic crystal, vibrations of linear mono and diatomic lattices, Determination of phonon dispersion by inelastic scattering of neutrons.

UNIT - V

Magnetism: Larmor diamagnetism. Paramagnetism, Curie Langevin and Quantum theories. Susceptibility of rare earth and transition metals. Ferromagnetism: Domain theory, Weiss molecular field and exchange, spin waves: dispersion relation and its experimental determination by inelastic neutrons scattering, heat capacity. Nuclear Magnetic resonance: Conditions of resonance, Bloch equations. NMR-experiment and characteristics of an absorption line.

Superconductivity: (a) Experimental results: Meissner effect, heat capacity, microwave and infrared properties, isotope effect, flux quantization, ultrasonic attenuation, density of states, nuclear spin relaxation, Gorter and AC and DC, Josephson tunnelings. (b) Cooper pairs and derivation of BCS Hamiltonian, results of BCS theory (no derivation).

Reference Books:

1. Huang : Statistical Mechanics
2. Reif : Fundamentals of Statistical and Thermodynamical Physics
3. Rice : Statistical mechanics and Thermal Physics
4. Kittel: Elementary statistical Mechanics
5. Kittel : Introduction to Solid State Physics
6. Patterson: Solid State Physics
7. Levy : Solid State Physics
8. McKelvy: Solid State and Semi-conductor Physics.

PAPER-VIII: (A) MICROWAVE ELECTRONICS

Max.Marks :100

Duration: 3hrs.

Note: Five question are to be set taking one from each unit(each question will have an internal choice).Student will attempt all the five questions. 40% weightage will be given to problems and numericals.

UNIT - I

1. Introduction to microwaves and its frequency spectrum, Application of microwaves.

Wave guides: (a) Rectangular wave guides: Wave Equation & its solutions, TE & TM modes. Dominant mode and choice of wave guide Dimensions Methods of excitation of wave guide.

(b) Circular wave guide-wave equation & its solutions, TE, TM & TEM modes.

(c) Attenuation - Cause of attenuation in wave guides, wall current & derivation of attenuation constant, Q of the wave guide.

2. Resonators: Resonant Modes of rectangular and cylindrical cavity resonators, Q of the cavity resonators, Excitation techniques, Introduction to Microstrip and Dielectric resonators, Frequency meter.

UNIT - II

3. Ferrites: Microwave propagation in ferrites, Faraday rotation, Devices employing Faraday rotation (isolator, Gyrotor, Circulator). Introduction to single crystal ferromagnetic resonators, YIG tuned solid state resonators.

4. Microwave Measurement:

(a) Microwave Detectors: Power, Frequency, Attenuation, Impedance Using smith chart, VSWR, Reflectometer, Directivity, coupling using direction coupler.

(b) Complex permittivity of material & its measurement: definition of complex of Solids, liquids and powders using shift of minima method.

UNIT - III

3. Microwave tubes: Spacecharge spreading of an electron beam, Beam focussings. **Klystrons:** Velocity Modulation, Two Cavity Klystron, Reflex Klystron Efficiency of Klystrons.

Magnetrons: types & description, Theoretical relations between Electric & Magnetic field of oscillations. Modes of oscillation & operating characteristics.

Gyrotrons: Constructions of different Gyrotrons, Field-Particle Interaction in Gyrotron.

UNIT - IV

6. (a) Avalanche Transit Time Device: Read Diode, Negative resistance of an avalanching p-n Junction diode IMPATT and TRAPATT Oscillator.

(b) Transferred Electron Device: Gunn effect, two valley model, High field Drift velocity, Different Modes for Microwave generation.

(c) Passive Devices: Termination (Short circuit and matched terminations) Attenuator, phase changers, E&H plane Tees, Hybrid Junctions. Directional coupler.

7. Parametric Amplifier: Varactor, Equation of Capacitance in Linearly graded & abrupt p-n junction, Manly Rowe relations, parametric upconverter and Negative resistance parametric amplifier, -use of circulator, Noise in parametric amplifiers.

UNIT - V

8. Microwave Antennas: Introduction to antenna parameters, Magnetic Currents, Electric and magnetic current sheet, Field of Huygen's source, Radiation from a slot antenna, open end of a wave guide and Electromagnetic Horns. Parabolic reflectors, Lens antennas. Radiation fields of Microstrip wave guide, Microstrip wave guide, Microstrip antenna calculations, Microstrip design formulas.

9. Microwave Communication:

(a) LOS microwave systems, Derivation of LOS communication range, OTH microwave systems, Derivation of field strength of tropospheric waves, . Transmission interference and signal damping, Ductpropagation.

(b) Satellite Communication: Satellite frequencies allocation, Synchronous satellites, Satellite orbits, Satellite location with respect to earth and look angle, earth coverage and slant range, Eclipse effect, Link calculation, Noise consideration, Factors affecting satellite communication.

- Reference Books:**
1. Electromagnetic waves & Radiating Systems: Jorden & Balmain.
 2. Theory and application of microwaves by A.B. Brownwell & RE. Beam (McGraw Hill) .
 3. Introduction to microwave theory by Atwater (McGraw Hill).
 4. Principles of microwave circuit by G.C. Montgomery (McGraw Hill)
 5. Microwave Circuits & Passive Devices by M.L. Sisodia and G.S. Raghuvanshi (New Age International, New Delhi)
 6. Foundations of microwave engineering by RE. Collin. (McGraw Hill).
 7. Microwave Semiconductor Devices and their Circuit applications by H.A. Watson
 8. Microwave by M.L. Sisodia and Vijay Laxmi Gupta. New Age, New Delhi.
 9. Antenna Theory, Part-I by RE. Collin & EJ. Zucker (McGraw Hill, New York)
 10. Microstrip Antennas by Bahl & Bhartiya (Artech House, Massachusetts)
 11. Antenna Theory Analysis by C.A. Balanis Harper & Row. Pub. & Inc. New York.
 12. Antenna Theory Analysis by E.A. W01""(J. Willey & Sons)
 13. Antenna Theory & Design by RS Elliott (LPHI Ltd. New Delhi)
 14. Microwave electronics by RE Soohoo (Addisen Westey public company,).
 15. Microwave Active Devices, Vacuum tubes by M.L. Sisodia new Age International New Delhi.
 16. Semiconductors & Electronics device by A. Barle vs (PHI, India).
 17. Solid State physical electronics by A. Vanderziel, (PHI, India).
 18. Hand book of microwave measurement Vol-II by M. Sucher & J.Fox (polytechnic Press, New York).
 19. Microwave devices & circuits by S.Y.Liao(PHI, India).
 20. Microwave Principles by H.J. Reich (CBS).
 21. Simple microwave technique for measuring the dielectric parameters of solids & their powder by J.M. Gandhi, J.S. Yadav, J. of pure & applied physics Vol. 30, pp-427431, 1992.

PAPER -VIII : CONDENSED MATTER PHYSICS

Max.Marks :100

Duration : 3hrs.

Note: Five questions are to be set taking one from each unit (each question will have an internal choice). Student will attempt all the five questions. 40% weightage will be given to problems and numericals.

UNIT - I

Simple liquids : order-disorder theory, Lindemann theory of melting, cell and hole theories of liquids, communal entropy and free volume concept; molecular distribution function, two particle distribution function and its relation with pair correlation function $g(r)$; derivation of internal energy of liquid and equation of state. **Structure factor** static structure factor and its relation with the pair correlation function. Determination of structure factor by X-ray and neutron scattering, Inelastic neutron scattering and dynamic structure factor, spacetime correlation function and its relation with dynamic structure factor properties of space time correlation function. Langevin equation for Brownian motion and its modification. velocity autocorrelation function mean square displacement. Relation between velocity autocorrelation function and diffusion coefficient.

UNIT - II

Liquid metals : Metallic interaction- kinetic energy, electrostatic exchange and correlation, pseudopotential formalism, diffraction model, structure factor, form factor for local and non local potential, energy eigen states, dielectric screening. Energy-wave number characteristics, calculation of phonon dispersion in liquid metals. Band structure energy in momentum and direct space, Ziman's resistivity formula. **Quantum liquids :** Distinction between classical and quantum liquids, criteria for freezing, phase diagram for He^4 , He I and He II, Tisza's two fluid model, Entropy filter, Fountain effect Super fluid film vehicle, Viscosity and specific heat of He^4 , first sound, second sound, third sound and fourth sound. Landau theory: Rotons and Phonons.

UNIT - III

Exotic solids : Structure and symmetries of liquids, liquid crystals and amorphous solids. Aperiodic solids and quasicrystals; Fibonacci sequence and Penrose lattice, their extension to quasi-crystal, synthesis and properties. Special Carbon solids: fullerene and tubules; formation and characterization of fullerenes and tubules. Carbon nanotube based electronic devices; method of synthesis of nanostructured materials: sol-gel, co-precipitation, effect of temperature on particle size; special experimental techniques for characterization of nanostructured materials: x-ray diffraction and XANES.

UNIT - IV

Phase transformation and alloys: Equilibrium transformation of first and second order. Equilibrium diagrams phase rule, interpretation of phase diagrams. Substitutional solid solution. Vegard's law intermediate phase, HumeRothery rules, interstitial phase (carbides, nitrides, hydrides, borides). Martensitic transitions.

2. Disordered systems: Disorder in condensed matter, substitutional, positional and topographical disorder, short and long-range order. Spinning, sputtering and ion-implantation techniques, glass formation ability, glass transition, nucleation and growth process. Anderson model for random system and electron localization, mobility edge, qualitative application of the idea of amorphous semiconductors and hopping conduction. Metglasses, model for structure of metglasses of glassy systems.

UNIT - V

Structure determination / characterization : Basic theory of X-ray diffraction. Indexing of Debye-Scherrer patterns from powder samples, examples from some cubic, non-cubic and non-cubic symmetries. Neutron diffraction-basic interactions cross-sections, scattering length and structure factor Mossbauer effect, hyperfine parameters-Isomer shift, quadruple splitting and Zeeman splitting. Application- Valence and coordination, site symmetry magnetic behaviour Discussion in context of ^{57}Fe . Electronic Structure Determination: Basic principles of X-ray, photoemission and positron annihilation techniques Qualitative discussion and positron annihilation techniques. Qualitative discussion of experimental arrangement and typical result for both simple as well as transition metals.

LIST OF EXPERIMENTS FOR M.Sc. FINAL

Scheme:

The examination will be conducted for two days, 6 hrs. each day. The distribution of the marks will be as follows :

	Marks
Two experiments	120
Viva	40
Record	40
Total	200
Minimum Pass Marks	72

LIST OF EXPERIMENTS (any eighteen) :

1. To determine half-life of a radio isotope using GM counter.
2. To study absorption of particles and determine range using at least two sources.
3. To study characteristics of a GM counter and to study statistical nature of radioactive decay.
4. To study spectrum of γ particles using Gamma ray-spectrometer.
5. To calibrate a scintillation spectrometer and determine energy of γ -rays from an unknown source.
6. (a) To study variation of energy resolution for a NaI (T) detector.
(b) To determine attenuation coefficient (μ) for rays from a given source.
7. To study Compton scattering of γ -rays and verify the energy shift formula

8. To study temperature variation of resistivity of a semi-conductor and to obtain band gap using four probe method.
9. To study hall effect and to determine hall coefficient.
10. To study the variation of rigidity of a given specimen as a function of the temperature.
11. To study the dynamics of a lattice using electrical analog.
12. To study ESR and determine g-factor for a given spectrum.
13. To determine ultrasonic velocity and to obtain compressibility for a given liquid.
14. Study, the characteristics of a given Klystron and calculate the mode number, E.T.S. and transit time.,
15. Study the simulated L.C.R. transmission line (audio frequency) and to find out the value for Z_0 experimentally from the graph.
16. Study the radiation pattern of a given Pyramidal horn by plotting it on a Polar graph paper. Find the Half power beam width and calculate its gain.
17. Find the dielectric constant of a given solid (Teflon) for three different lengths by using slotted section.
18. Find the dielectric constant of a given liquid (organic) using slotted section of K-band.
19. Verification of Bragg's law using microwaves..
20. Determination of Dielectric Constant of a liquid by Lecher wire.
21. Study of a Heat Capacity of Solids.
22. Study of lattice dispersion.
